Q: What is the difference between "by nature" and "by design" in regards to questions about games? Questions about games are often phrased with the word "by nature" or "by design" at some point in them. What is the difference between these two words? I feel like they mean the same thing, but "by design" sounds more formal and technical than "by nature". Examples: Does [game] have a nature behind it, in addition to its design? vs. Does [game] have a design behind it, in addition to its nature? A: Merriam-Webster meaning 1b- (of matter or events) contrived, directed, or intended by nature Meaning 2 is The way things are supposed to be; the way they are intended to be. So "by nature" means that it is in the standard design, not that there are no minor variations from it. "By design" implies that there are deviations from the standard design, probably manufactured ones.

Q: Is there a faster way to get the sum of the data in a field and return it in another field on SQLite? I am trying to grab the sum of the sum of a field from the last 2 rows of a table (which I have no control over when querying the data). The app I am working on is a memory game, meaning that the correct answer is stored in a field. I have a couple of UIs which need to display the "correct" number. To do this I grab all of the data, loop through it and calculate the sum of the correct field, and then return the sum to each UI. Each UI needs to deal with two different pieces of data, so I have to make another round trip to grab all the data, calculate the sum of the correct fields, then send back to each UI. I was wondering if there was a way I could just grab the sum of the correct fields and return it rather than having to loop through it all, and then grab all the data, loop through it, and sum the correct values. My current code looks something like this:

```

UIList.get(0).setText(dasTotal(data)); //The function getting the sum of the data in a field
and returning it in another field: public static int dasTotal(SQLiteDatabase db) { int
rowIndex = 0; Cursor cursor = db.rawQuery("SELECT sum(correct) AS total FROM
questions WHERE questionID=?",new String[]{String.valueOf(rowIndex)} );
cursor.moveToNext(); int result = Integer.parseInt(cursor.getString(0)); cursor.close();
return result; }

```

As you can see, I've marked the slow part up there. I figure it's worth pointing out that each row in the table is 5-100 entries long (rows come from an httprequest, so the data can be several hundred rows). I'm aware that SQLite's SELECT function may be inefficient, but I don't have the option to use the Google SQLite client at the moment and I don't know of a good way to replicate the functionality. A: My current solution is to use an SQLite table: CREATE TABLE IF NOT EXISTS high
