Phoenix 1.5 Beta 8: A New Version of the Web Framework for Elixir

Phoenix is a web framework for the Elixir programming language that aims to provide high performance, productivity, and scalability. Phoenix 1.5 beta 8 is the latest pre-release version of the framework that introduces some new features and improvements.

One of the main features of Phoenix 1.5 beta 8 is the support for LiveView, a library that enables interactive web applications without writing any JavaScript. LiveView allows developers to write server-side code that renders dynamic HTML and handles user events, making it easier to create rich user interfaces with minimal code.

Another feature of Phoenix 1.5 beta 8 is the integration with Telemetry, a library that collects and reports metrics and events from Elixir applications. Telemetry enables developers to monitor the performance and behavior of their Phoenix applications using tools like Grafana and Prometheus.

Phoenix 1.5 beta 8 also includes some changes in the project structure and configuration, such as using Mix releases instead of Distillery, using Ecto SQL instead of Ecto, and using Phoenix PubSub Redis instead of Phoenix PubSub PG2. These changes are intended to simplify the deployment and management of Phoenix applications.

Phoenix 1.5 beta 8 is available for download from [this link](#)^[^3^]. The official documentation and guides can be found at [this link](#). The source code and issues can be accessed at [this link](#).

Phoenix 1.5 beta 8 is compatible with Elixir 1.9 or later and Erlang/OTP 22 or later. To install Phoenix 1.5 beta 8, you need to have Hex, the package manager for Elixir, installed on your system. You can install Hex by running the following command in your terminal:

```
mix local.hex
```

Then, you can create a new Phoenix project by running the following command:

```
mix phx.new project_name
```

This will generate a new directory with the project files and dependencies. You can then change into the project directory and run the following command to start the Phoenix server:

```
mix phx.server
```

You can now visit <http://localhost:4000> to see your Phoenix application running.

To use LiveView in your Phoenix project, you need to add the `phoenix_live_view` dependency to your `mix.exs` file and run the following command to install it:

```
mix deps.get
```

Then, you need to add the following line to your `endpoint.ex` file to enable LiveView:

```
socket "/live", Phoenix.LiveView.Socket
```

You can also add the following line to your `router.ex` file to mount LiveView routes:

```
live "/live", Phoenix.LiveView.Router
```

Now, you can create LiveView modules and templates in the `lib/project_name_web/live` directory. A LiveView module is a Elixir module that implements the `Phoenix.LiveView` behavior and defines the `render/1` function that returns the HTML template. A LiveView template is a file with the `.leex` extension that contains HTML and Elixir expressions. You can use the [live_render/2](#) helper to render a LiveView module from a controller or another LiveView.
